CompanyGraph — One core, and the words your company adds

Core holds what every company shares, and a pack what only some kinds of company need. Your own words go into kinds and sections.

RESTS ON `concept Pack`

Robert Blust · Software Engineer & Architect

Ask the model

01

Too small, too large

A vocabulary too small leaves facts out. One too large makes every company carry types it leaves empty.

RESTS ON

```
strategic-objective Core holds a company without running out of vocabulary
```

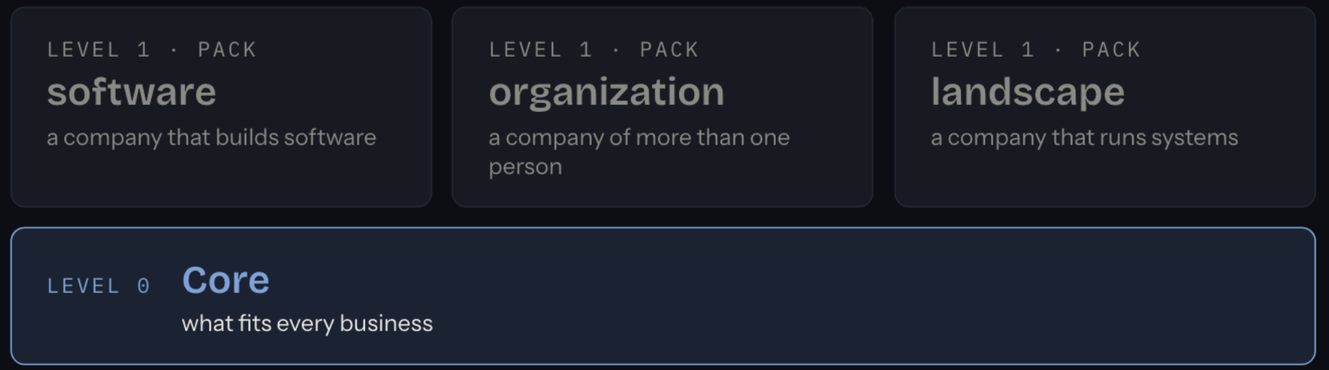

Ask the model

02

Level 0: core

What fits every business. Core defines a type; it does not oblige you to fill it.

RESTS ON `domain Core` `concept Core`

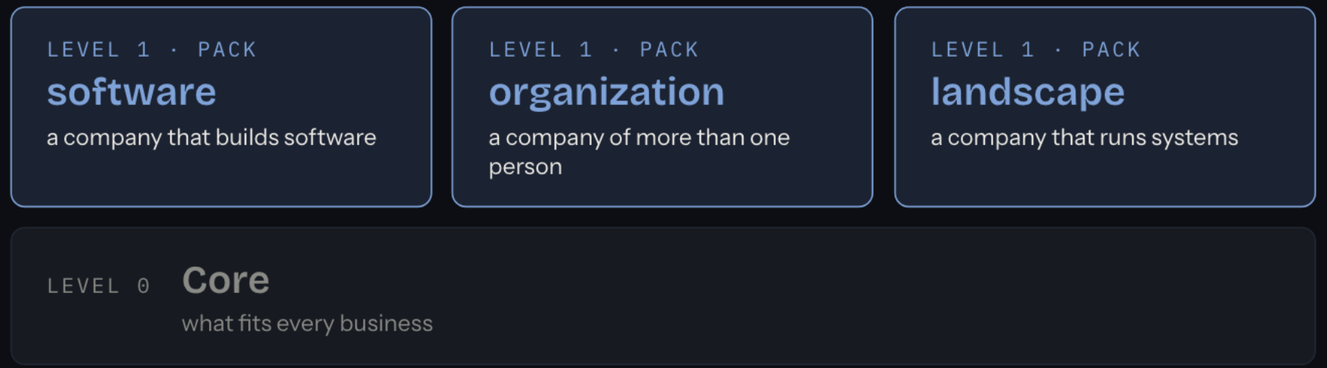

Ask the model

03

Level 1: a pack

Vocabulary only some kinds of company need at all. For any other company its types are absent, not optional.

RESTS ON `concept Pack`

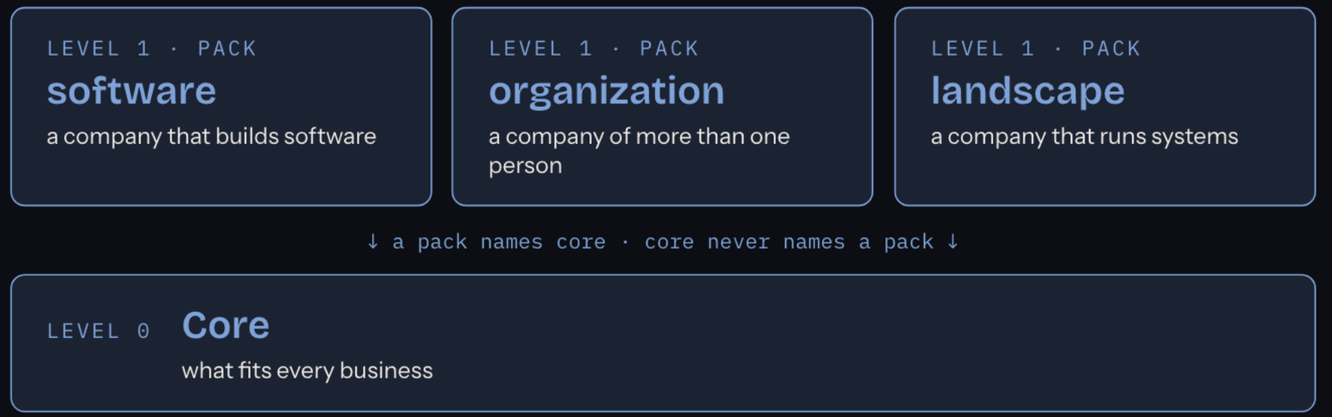

Ask the model

04

The one-way rule

A pack names core; core never names a pack. Taking one asks nothing new of a page you already have.

RESTS ON `concept Pack` `concept Reference`

Ask the model

05

Your own sorts

A kind is a page in your own words that sorts the pages of a type: product kind, decision kind, group kind, system kind. It adds no type.

RESTS ON `product-kind Software`

model/product-kinds/software.md

```

source: Local
rank: 10
---
# Software
> What CompanyGraph ships to be installed and run: the metamodel package with its checks,
  server, plugin and tooling.
```

Ask the model

06

Your own sections

A section is open and a field is closed: a page may carry prose its schema does not declare.

RESTS ON `decision A section is open and a field is closed`

model/concepts/pack.md

```
# Pack
> Vocabulary only some kinds of company need at all …

## Relations  declared
| Concept | Cardinality | As |
| Type | one to many | |

## When we reach for one  could be added · not declared, read as prose
When a company needs a type at all, not when it might.
```

Ask the model

07

Taking a pack

`init --pack` when you start, `upgrade --pack` later: vendored beside core, listed in the manifest, checked and moved with it.

RESTS ON `concept Instance` `concept Release` `concept Pin`

```
$ companygraph upgrade --pack organization
core 0.65.0 → 0.65.0: 10 written, 0 removed
  packs: organization, vendored beside core
  written, since the instance had none, and its own from now on: model/group-
  kinds/README.md, model/groups/README.md, model/jobs/README.md
√ model/ against meta/core, meta/organization/ at core 0.65.0: the mechanical checks pass
  not checked: every `## Writing rules` in every schema — that is the agent pass, R0
```

Ask the model

08

Do you need one?

Take a pack when your company is that kind of company, and only then.

RESTS ON `concept Pack`

You build software — `software`
bounded contexts, concept designs, aggregates, domain events and feature designs

More than one person works here — `organization`
groups, group kinds, jobs and the two lines that run through them

You run systems — `landscape`
systems, system kinds, data objects and services

Ask the model

09

When nothing fits

Ask with a feature request. New vocabulary starts from a pattern a real company shows, not from a wish list.

RESTS ON `process Feature request` `question What if the vocabulary doesn't fit our company?`

Ask the model

10

The pack talks

One talk follows for each pack, for people who already work in the method it draws from.

SOFTWARE	Domain-driven design, as pages you can check
ORGANIZATION	Two lines through one company
LANDSCAPE	Your landscape, in ArchiMate's words

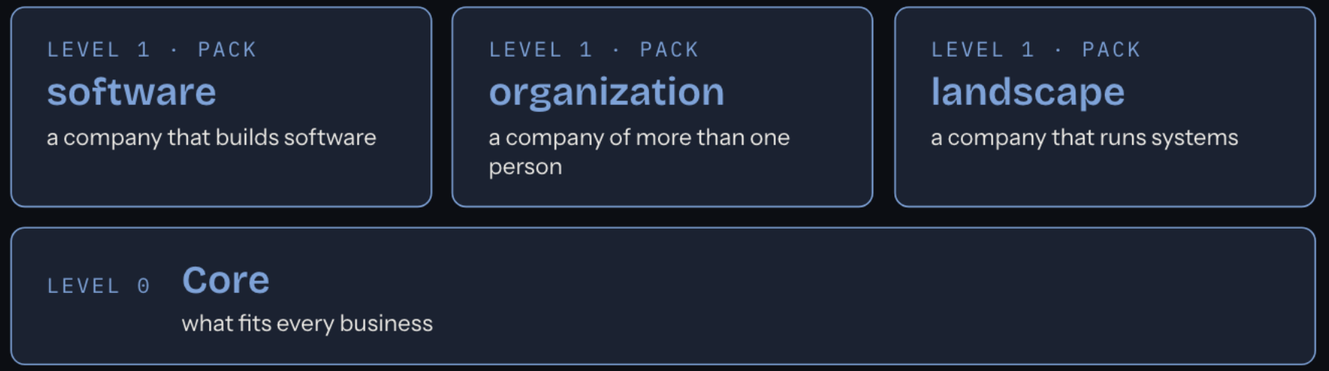

Ask the model

11

Take only the words your company needs

Core for every company and a pack for your kind. Your own words go into kinds and sections before any new type.
